

ACO-HH — Ant Colony Optimisation Hyper-Heuristic (Chen et al. 2007 scheme)
Ants walk a graph whose vertices are low-level operators, not customers. Pheromone $\tau[i][j]$ and visibility $\eta[i][j]$ live on operator→operator transitions; each journey is an operator sequence applied to the ant's current routing solution. Objective minimised: routing cost + $pv \cdot (\# \text{ capacity-violating routes})$, with strategic oscillation of pv .
