

SANS — Simulated Annealing Neighbourhood Search (engines "new" and "og")
Single-vehicle profit-maximising SA over a set of routes plus a pool of removed bins. The "new" engine runs geometric-cooling SA with 18 route/add operators and re-heating; the legacy "og" (LAC) engine runs a fixed-iteration annealing over 19 random move/swap procedures followed by uncrossing, local-search refinement and rebalancing.
